

1. Description

The FRONTSEAL® is an all elastomer axial seal for shafts and bearings. It seals axially against a counterface. This type of seal has been used widely for several applications and has proved to be reliable and effective against dust, dirt, water and oil splash and other media.

The ring consist of three parts:

- a - The seal body, installed with interference to the shaft.
- b - The hinge, acting as a sprung connection between the body and the lip.
- c - The conical self adjusting lip which provides the actual dynamic sealing against the counterface.

The counterface can be the outside of the bearing cap, a washer or any suitable metal pressing.

2. Standard Seal Types

The FRONTSEAL® is manufactured in four standard profiles:

VA type:
is the most common profile. It has a perpendicular rear face. Wide range of sizes, from 3 to 2020 mm shafts.

VS type:
with wide body to ensure higher radial force than VA type. Range of sizes from 5 to 210 mm shafts.

VL type:
this seal is intended for applications where space available is limited. Range of sizes from 135 to 630 mm shafts.

VE type:
is our heavy duty large diameter seal, used in steel mills, paper mills and rolling mills as a dirt/water excluder seal. A standard clamping band can be used to improve axial fixation.

Other types, modifications or larger diameters available upon request.

3. Elastomeric Sealing Materials

3.1 Nitrile rubber NBR

This elastomer is a copolymer of butadiene and acrylonitrile and is used for the majority of conventional fluid sealing applications.

Physical data:

- Working temperature range: -40° C to $+120^{\circ}\text{ C}$ in oil / $+90^{\circ}\text{ C}$ in water
- Tensile strength: up to 15 MPa
- Standard colour: black

Advantages:

- Good resistance to mineral oil and grease
- Good resistance to water and radiator fluid
- High tear strength

Limitations:

- Poor resistance to high-alloyed hypoid oil
- Poor resistance to ozone, weathering and sunlight.
- Not resistant to automotive brake fluid (glycol based)
- Poor resistance to polar fluids (ketones, ethers, esters)
- Poor resistance to chlorinated hydrocarbons (carbon tetrachloride, trichlorethylene)
- Poor resistance to aromatic solvents.

3.2 Fluorinated rubber FPM

Mostly known under the trade name VITON from Du Pont, TECHNOFLON from Montedison and FLUOREL from 3M.

It has good chemical resistance and is recommended for high temperature applications.

Physical data:

- Working temperature range: -30° C to $+200^{\circ}\text{ C}$
- Tensile strength: up to 15 MPa
- Standard colour: brown

Advantages:

- Excellent resistance to mineral oil and above all high-alloyed hypoid oils
- Excellent acid resistance
- Good resistance to aromatic and chlorinated hydrocarbons
- Excellent resistance to ageing, ozone and weathering.

Limitations:

- Limited cold flexibility
- Poor resistance to polar fluids (ketones, ethers, esters).

3.3 Silicone Rubber SIL

Also referred to as MVQ

Physical data:

- Working temperature range: -60° C to $+220^{\circ}\text{ C}$
- Tensile strength: approx. 3-7 MPa
- Standard colour: red

Advantages:

- Retains flexibility down to very low temperatures
- Withstands continuous heating at high temperatures without hardening
- Resistant to mineral oils and greases
- Excellent resistance to ageing, weathering and ozone
- Good chemical resistance to alkalis.

Limitations:

- Not recommended for use with hydrocarbons, such as petrols and paraffin, and lighter mineral oils.
- Not resistant to hot water, acids and non-mineral automotive brake fluids.
- Poor tensile and tear strength
- Poor wear resistance.

3.4 Chloroprene rubber CR

Mostly known under the trade name NEOPRENE from Du Pont.

Physical data:

- Working temperature range: -40° C to $+80^{\circ}\text{ C}$
- Tensile strength: up to 15 MPa

Advantages:

- Excellent resistance to ageing, weathering and ozone
- Moderate resistance to mineral oils and greases.

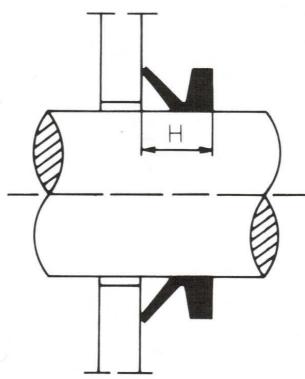

Limitations:

- Tends to harden or stiffen at low temperatures
- Not resistant to non-mineral automotive brake fluids.

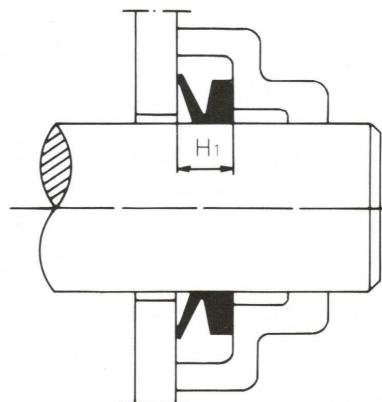

4. Installation and operation

4.1 Fitting

Fitting of the FRONTSEAL® is very simple. The ring must be slightly stretched and pushed along the shaft. It can either be done manually or with a simple tool, in a way that the distance to the counterface can be maintained constant using little pressure.

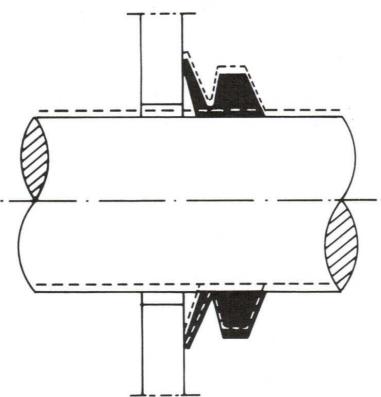

FRONTSEAL®
not preloaded

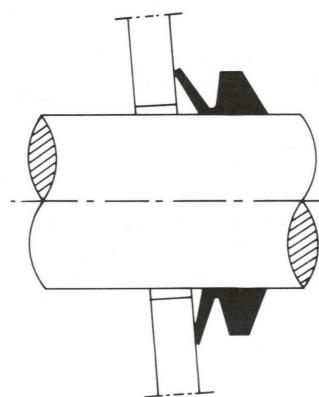

FRONTSEAL® fitted
with preloading using a tool

4.2. Eccentricity / Misalignment

The V-shape of FRONTSEAL® provides an effective and reliable sealing even with oval section or eccentrically turning shafts. Sealing is not even affected by a slightly tilted counterface.

oval and/or eccentrically
turning shaft

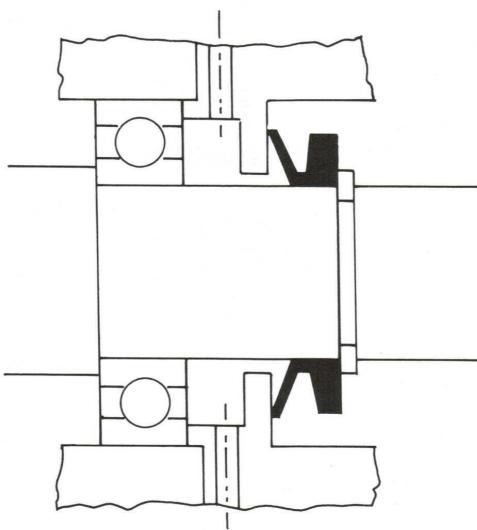

tilted
counterface

4.3 Counterface

The counterface finish is very important for an efficient sealing and for useful life of the seal. The surface must be smooth, free of scratches and sharp peaks, finish of $R_t = 1$ to $4 \mu\text{m}$.

Several materials can be used: soft metals, (light alloy, cast metal, etc.) only in well lubricated applications.

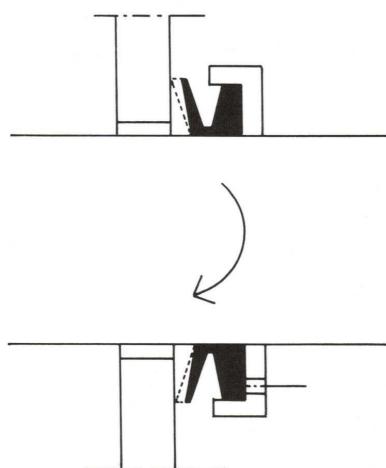

For unlubricated applications the surface should be treated with a dry lubricant such as Molykote spray.

4.4 Peripheral speed

At peripheral speed up to 8 m/s the lip of the FRONTSEAL[®] has a good pressure against the counterface and it has the function of a light contact seal.

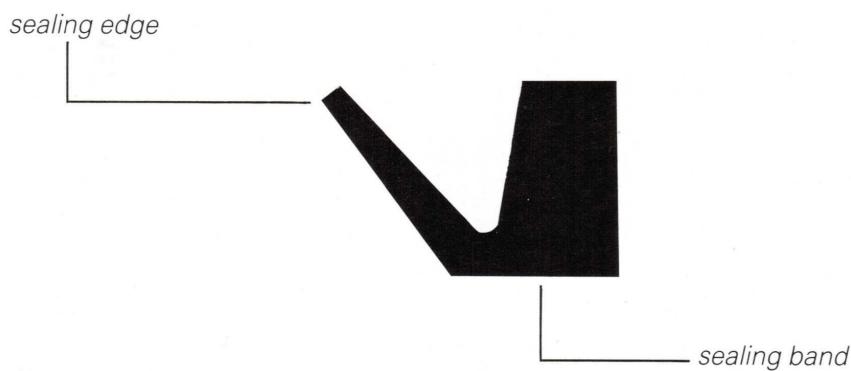

Over 8 m/s the seal must be supported axially and above 12 m/s radial retention is necessary, mounting the FRONTSEAL[®] in an axial groove or applying an adequate support.

5. Production and Quality Assurance

Our FRONTSEAL® is manufactured according to Quality Assurance Standards ISO 9002. All production phases are checked and all measurements are recorded and stored for eventual tracing.

Our FRONTSEAL® is individually inspected to ensure that sealing edge and sealing band are without faults. Also small cracks and shorts which could cause a split during mounting or functioning of the seal are not accepted.

6. Storage and Handling

Some storage precautions must be taken in order to avoid deterioration of the material. FRONTSEAL® should be stored in a dust free and dry atmosphere and they must be kept in their original envelope which should only be opened just before installation. Samples should be repacked after inspection.

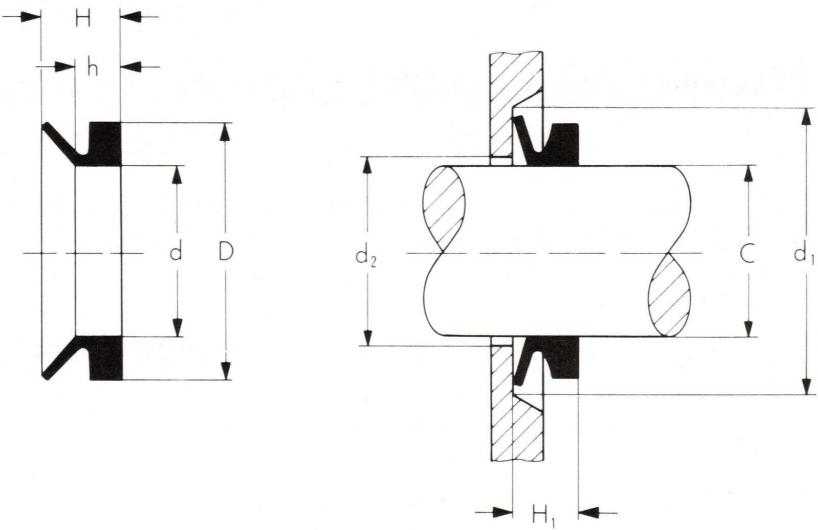

Do not drop FRONTSEAL® on shelves or boxes, nor hang seals on hooks, wires or nails, since in either case the seal can be damaged.

Seals should be stored on a first-in first-out basis to avoid ageing on the shelf. Avoid storage near sources of heat or near electrical equipment that may generate ozone. Also keep away from direct sunlight.

Avoid unnecessarily compressing the lip during storage.

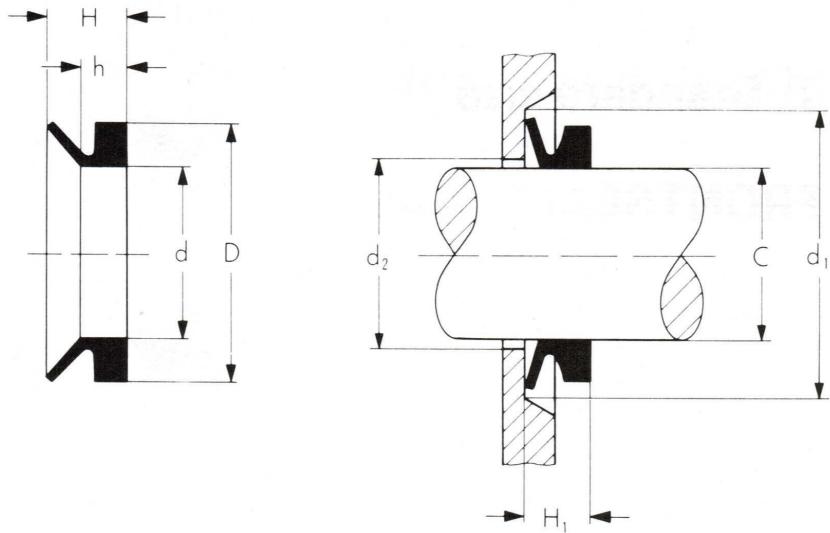

7. Standard size

FRONTSEAL® VE

FRONTSEAL® VE can easily be fitted with a standard clamping band for axial fixation in high speed applications.

Ring dimensions

$H = 65$
 $h = 32$
 $W = 30$

Assembling dimensions

$H_1 = 50 \pm 12$
 $d_2 \text{ max.} = C + 24$
 $d_1 \text{ min.} = C + 115$

AXIALDICHTRING / AXIAL-SEAL

Gamma-Dichtringe ®

Die AXI 01 und AXI 02 sind Axialdichtungen, die aus zwei Bauteilen bestehen, einem beschichteten Metallring und einem aus der Form vulkanisierten Elastomerdichtelement. Der Metallring schützt die Elastomerdichtung gegen Beschädigungen, dient als Halterung und Abstützung der Elastomerdichtung und wirkt gleichzeitig als Schleuderscheibe.

Die Elastomerdichtung ist nicht fest an den Metallring gebunden, sondern auf den Metallring aufgedehnt und wird zusätzlich durch den axialen Bördelbund gehalten. Bei dem AXI 02 ist der Metallring am Außenmantel in axialer Richtung verlängert. In Kombination mit der umlaufenden Nut in der axialen Gegenlauffläche wird eine zusätzliche Labyrinthabdichtung gebildet.

The AXI 01 and AXI 02 are axial seals consisting of 2 sections, one coated metal ring and one mould vulcanised elastomer sealing element.

The metal ring protects the elastomer seal against damage, serves as a stand and support for the elastomer seal and simultaneously acts as a flinger. The elastomer seal is not firmly bonded to but stretched over the metal ring and is additionally held by the axial flange.

With the AXI 02 the metal ring is extended in an axial direction on the outer sheath. Additional labyrinth sealing is created in combination with the circulating groove in the sliding surface.
